# Modules - Reports [rpt]

Reports module implements the logic of defining a report, preparing it and make in available for download in CzechIdM GUI. Other modules can provide its own report bulks which will then be available in [rpt].

[rpt] module itself contains one example report. Other reports you can get via [implemented reports \[reports\] module](#) or [implement yourself](#).

Via reports module administrators can prepare reports of identities, roles and many others.

Basic reports available:

- Users (example): formats - json, xlsx
- Provisioning operations - Overview of waiting (active) operations in provisioning queue and attributes, witch will be provisioned to target system. Supported formats: XLSX
- Identities - assigned incompatible roles. Supported formats: XLSX

All generated reports are available in web GUI, where also the status of the report is shown (Running/Executed). There, after the report is prepared, users can download it.
