Changing permissions without approval

There are two ways of how to make a change in permissions without approval.

Disabling the approval processor

After submitting a request, an event is called out which is captured by processor "**role-request-approval-processor**". If we disable this processor, all submitted requests will be realized immediately without any approval.

> By disabling the approval processor, all submitted requests will be realized immediately for all users in the system regardless of their permissions.

Request attribute "Execute immediately"

A request for permission change contains attribute "**executeImmediately**". If this attribute is set to "true", the request will be executed immediately after submitting it. A submission without approval can be executed only by users having permission "**ROLEREQUEST_EXECUTEIMMEDIATELY**". If an event marked in this way is executed by a user without this permission, an exception will be called out.
